Summary

Full Stack Developer with experience in **Next.js**, **React**, **TypeScript**, **C#**, and **ASP.NET**, working on the development and modernization of corporate ERP systems. I develop complete modules from scratch, from requirements gathering to production deployment, applying Clean Architecture, SOLID principles, and best practices for **REST APIs**. I have experience in the complete development cycle: from database modeling and layered API architecture (Controller, Application, Repository) to configuring environments with **Nginx** and delivery pipelines across multiple environments (DEV/UAT/PRD). I work with **Scrum** methodology, PR workflow with code review, version control in **Azure DevOps**, and integration with automation tools such as **N8N**.

Technical Skills

- **Languages:** TypeScript, JavaScript, SQL, C#
- **Front-end:** Next.js (App Router, SSR, SSG), React, TailwindCSS, Material UI (MUI), Redux, React Query / TanStack Query, ZOD, React Hook Form, Jest
- **Back-end:** ASP.NET Core, REST APIs, Entity Framework, Clean Architecture, FluentValidation, Docker
- **Databases:** PostgreSQL, Firebird, SQL Server, Prisma, Entity Framework
- **DevOps & Tools:** Azure DevOps, GitHub Actions, Docker, Nginx, Git, Linux (WSL), macOS
- **Methodologies:** Scrum, Code Review, PR Workflow, Clean Architecture, SOLID, Clean Code, REST API Design, Modularization

Professional Experience

Gráfica Canastra | June 2025 – Present

Full Stack Developer

- I developed a complete **industrial maintenance module** (front-end + back-end + deployment) from scratch, adding a unique product to the company's operation, including equipment registration, location by sector, maintenance plan history, and label printing with real-time validation.
- I designed and implemented several **RESTful endpoints** with ASP.NET following Clean Architecture (Controller → Application → Repository), including validations, pagination, caching, and business rules with recursive functions.
- I built a **Service Order (SO)** module with an approval workflow, time tracking, checklists linked to maintenance plans, and a unified PATCH endpoint for status updates—an architectural decision that reduced the number of API calls and simplified code maintenance.
- I led the **migration of a React/Vite application to Next.js**, reducing technical debt and standardizing the internal ERP codebase with a standalone build for deployment on Nginx.
- I configured and maintained **3 environments (DEV, UAT, PRD)** with Nginx on a corporate server, ensuring a continuous delivery pipeline.
- I implemented secure **authentication with AuthGuard and GuestGuard**, protecting

application routes with token control via Redux and automatic redirection based on session state.

- I implemented **React Query** and **custom hooks** in the Next.js project, separating business logic from the UI layer and improving code quality. I reduced code review issues from ~30 per PR to zero, a fact recognized by the senior team.
- I integrated a corporate system with **N8N** to automate reporting and operational data tracking, creating an API exposed via a public URL with token authentication — eliminating the need for direct system access by the manager.
- I modeled a **relational database** (Firebird/IBExpert) and implemented business rules with recursive validations and foreign keys for new modules.
- I created **several complete screens** with front-back integration: Terminal, Browse Folders, History, Equipment, Checklist, Maintenance Plans, Work Orders, Location, all with mobile responsiveness.
- I worked in a **complete agile workflow with Azure DevOps**, creating tasks, estimating by points, preparing PRs with templates and mandatory approval, and managing the pipeline of DEV → UAT → PRD environments.
- I deployed **ASP.NET APIs** and **Next.js front-ends** on Windows Server, and also configured GitHub Actions to automate deployments and eliminate manual processes.

Bebedouros Cânovas | January 2024 – May 2025

IT Sector Manager

- I participated in the implementation of CRM and ERP systems, assisting with database migration and team training.
- I managed IT infrastructure: Windows Server, VPNs, domains, DNS, and provided ongoing technical support.

Relevant Projects

SmartBudgetPro | (Gestão Financeira Pessoal) | .NET 8, C#, Clean Architecture, PostgreSQL, Next.js, TypeScript, TanStack Query, Tailwind CSS, ShadCN UI (Under development)

Full-stack financial control application with RESTful API in .NET 10 following Clean Architecture (DDD, Use Cases, Repository Pattern) and JWT authentication. Allows management of transactions (revenues, expenses, and recurring transfers), custom categories, and monthly budgets with automatic status calculation (OK/Alert/Exceeded). Interactive dashboard with charts via Recharts, tables with TanStack Table, customizable layout with drag & drop, and dark mode support.

 [GitHub - SmartBudget PRO](#)

Portfol.io (Gallery and Authentication) | Next.js, TypeScript, NextAuth, PostgreSQL, Cloudinary, Tailwind CSS, ShadCN UI

Full-stack application with complete authentication via NextAuth.js, profile management, and image upload integrated with Cloudinary. Allows registration, login, password recovery, and the publication of public or private photos in an interactive gallery. Modern interface using Tailwind CSS and Shadcn UI, dynamic notifications with Sonner, and automated emails via Resend.
